Major differences between mammalian cell culture and Drosophila cell culture Those who are trained in mammalian cell culture should be aware of several major differences in the techniques used for mammalian and Drosophila cell lines: • Temperature of culture: Drosophila cell lines should be grown at 25° C., unless otherwise indicated.

We synchronized Drosophila cell lines (Schneider's line 2 and K c) by allowing the cells to enter the stationary phase of growth and then diluting them into fresh culture medium. The cells of both cell lines entered S phase, after an 8- to 14-hr delay, in a state of partial synchrony; 60 to 80% of the cell population accumulated in S phase. Measurements of the cell cycle phases of Schneider's line 2 cells (S=14 to 16 hr; G 2 =6 to 8 hr; M=0.4 hr) were similar to those of K c cells.
